

ABSTRACT OF THE DISCLOSURE

An information system is provided including a server, a data storage device and a connection device; and is characterized in that the connection device includes a
5 memory unit for storing a test list in which are associated information identifying the data storage device to be tested and setting information relating to tests; and a test unit which upon input of the input/output request, references the test list and judges whether the destination of the
10 input/output request is the data storage device to be tested, and if the destination of the input/output request is the storage device to be tested, outputs the input/output request to the transmission/reception unit after a prescribed length of time.
